Daniel — Casa Verde Riverside opened four hours late yesterday, ten days after they asked us for the kit. Dan's van showed three receipt printers in the book, so I sent him. Two of the three were dead units he had pulled out of other restaurants. He drove to the hub and back in the middle of the job.

Lena then asked how many vans need restocking this week. I said three, you said four, Faris says six. Same file. The difference is not arithmetic, it is what each of us counts:

- I take the latest count in the book and compare it with the minimum written on the same row. Three vans: Sami, Yusuf and Pavel.
- You compare with the June minimums, count paper in boxes, and leave the kitchen screens out. Four vans — and Pavel is not one of them, because his cable minimum in my book is a number from before June that nobody updated.
- Faris takes the dead pulled units out of the count. Six.
- Khalid's van has been at the garage since 18 August. The book still says it carries three terminals and five printers. Khalid has installed twenty-one units since then, out of the pool van, which the book says is empty.
- Van 3 shows **minus two terminals**, and there are seven rows in the Jobs sheet typed **Restock?** that I cannot explain.

This is the fourth time this quarter we go into Lena's Monday meeting with three numbers. I am not doing it again with a spreadsheet.

One thing only. A unit my technicians pull out of a restaurant is **not stock**. It is dead, it is in a bag in the back of the van, and it stays there until somebody has forty minutes to drive to the hub. They go back when Daniel shouts; between shouts they sit in the van and get counted. The Jobs sheet says what came out of every restaurant. The hub-run rows say what went back. Nobody has ever subtracted one from the other. There are eleven dead units in vans this morning. Four of them are in Ahmed's.

And for the record: when a van goes into the garage, the technician takes his stock with him into the pool van. He signed for it; it is his. Nobody has ever told us to write that down anywhere.

Faris — stock is issued to a **van**. The hub issues against a plate number. The insurer insures a vehicle. The Monday count is by vehicle. When Khalid moves five printers into the pool van and the book says they are in a van at the garage, both vans are wrong, and the restock list goes to the wrong one.

The process is on your own board: a van coming off the road returns its stock to the hub, and the pool van is issued its own. Jonas did exactly that in August and it is in the book — issued on the 4th, emptied on the 7th. Yes, it costs a morning.

@Noor Siddiqui with respect, this is not a hub counting problem. **We issue boxes to a van and we count boxes in a van.** Whether a printer works is Field's problem, and the dead ones should be back here within the week, which they never are. The minimums are the minimums: two terminals, three printers, two boxes of paper, agreed on 3 June. Paper is in boxes because that is how it is issued, and 35 rolls does not meet a minimum of two. Kitchen screens do not count; they ship direct, and whoever put them on the June list should take them off.

Technicians have always swapped stock between vans in the car park. Thirty-odd times this quarter, and it is what keeps openings on time. Your book records each one as a negative number in one van and then someone deletes it. That is why van 3 shows minus two terminals. It is not wrong. It is describing something you have decided is not allowed to happen.

Hello — adding you to this thread rather than writing you a tidy summary, because the tidy summary is the thing we keep getting wrong.

Noor runs Dispatch, Faris runs the technicians, Daniel runs the hub. All three are competent and all three are describing a different company. I have three answers to "how many vans need restocking" — three, four and six — from three people working from the same spreadsheet. And the restock count is the small problem: our promise is next working day anywhere in the city, and Noor's sheet says we average almost a week.

I am not asking you to settle who is right, and I am not asking you to fix a system. There is no system; there is a spreadsheet, a group chat and a shelf. I am asking you to build the first one: one place where what is on a van is recorded, one way of deciding which van takes a job, and one list for the hub. Noor's stock book is attached; Faris's board is in the pack. Where they disagree, pick something — deliberately — and tell me what you picked and why.

Lena
